

Mapped & Matched Polyester Film

Polyester - Mapped & Matched

Film

Polyester base films have an inherent orientation in them due to the way they are extruded by film manufacturers. This orientation can cause curling when a polyester film is used on two sides of a print or card/ID. D&K uses a propriety process to map out this orientation and match up appropriate sections of the master roll to create a flat card or other print.

Blue lines represent the orientation inherent in polyester base films

Non-Mapped & Matched Polyester

Non mapped & matched polyester films will create a curl, or "potato chip" effect.

Mapped & Matched Polyester

Matching corresponding sections of a polyester film roll will equalize the orientation to produce a completely flat laminated product.
