

## **Roller Press Care & Maintenance**

**Roller presses should be cleaned regularly to remove any dust/dirt or adhesive residue that may affect lamination results.**

**Do not operate equipment when any panels or guards have been removed.**

**Do not wear loose clothing, ties, jewelry, etc. that may get caught in rollers.**

Do not use any sharp objects or harsh chemicals that may damage the machine or the rollers.

Clean the machine body with a soft cloth that has been dampened with soap and water.

Rollers should be cleaned regularly with a rubber roll cleaner or other laminator cleaning kit.

Adhesive deposits are easier to clean when the rollers are warm. Do not use alcohol or solvent cleaners when the rollers are hot.

Wear gloves to protect your hands while cleaning.

Use a lint-free cloth to wipe away any debris.

Keep the rollers open when not using the laminator. This will prevent flat spots from developing, which will affect lamination.

Slowly rotate the rollers while the press is warming up. The rollers will heat consistently and evenly to prevent hot spots from developing. This also helps prolong the life of heated rollers.
